

Predicting fraudulent insurance claims

Project Landscape

1 | Data

The dataset is an open-source dataset, available to any on the internet.

There was no web-scraping required, as the data was available on a public GitHub repo.

It is a structured dataset that is provided in a dataframe format

2 | Information

I will be using the data to predict fraudulent insurance claims. This is a problem that can be solved using data analysis and machine learning.

This is data on insurance claims that was collected in 2015. The dataset encompasses detailed records from various insurance companies across the United States.

3 | Knowledge

This project will require technical skills such as data analysis, feature engineering & machine learning to build a predictive model.

The domain knowledge required is around insurance industry fundamentals & behaviours in this industry. Additionally, claims processing knowledge would be beneficial
